## HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

## DETAILED ACTION

### ***Allowable Subject Matter***

1. Claims 1-31 have been allowed.
2. Lindeborg et al (US Pat 6,857,027) teaches a system and method are disclosed for detecting and preventing bridge loops in a relatively low cost bridge module designed for installation in a network hub. The bridge module monitors its external communication ports for any data unit having a destination address matching a bridge multicast address. When a data unit having a destination address matching the bridge multicast address is detected, the bridge module compares the MAC source address of that data unit to the previously stored MAC source address from the bridge protocol data unit detected on the intra-hub communication path. In the event that the MAC source address of the data unit detected on the external communication port matches the previously stored MAC source address, the bridge module disables operation of the respective one of its external communication ports at which the data unit was received. In one embodiment of the disclosed system, the bridge module further monitors its external communications ports for routing protocol messages. In the event that a routing protocol message is detected on one of those external communications ports, the bridge module disables that port.
3. Shani (US Pat 6, 023, 563) teaches a Network Switch features database means for correlating MAC addresses, network addresses, network switch port addresses and VLAN configuration. The Network Switch maintains the network presence of a bridge (i.e., it does not have its own MAC or network address) and operates promiscuously by

having internetwork traffic travel through the Network Switch and entering address data of the data packets. The Network Switch thus learns the network topology and subsequently redirects and re-addresses packets addressed to a router and transmits them to their destination MAC address. In this way, the workload on the router is greatly reduced. Any packet having an unknown address is forwarded to the router as originally sent. The related method discloses an internetwork configuration featuring a plurality of networks connected with at least one Network Switch device and at least one router, and serves to alleviate the workload which had been placed entirely on the router according to prior art configurations. The Network Switch also features various modes of operation for handling address resolution requests.

5. The following is an examiner's statement of reasons for allowance:

The prior arts of record fail to teach, or render obvious, alone or in combination a method to perform the claimed MAC move and the MAC move threshold.
